

While some people consider global warming to be the most pressing environmental problem, which we have at the moment, others believe that deforestation has a more devastating impact on our world. Discuss both sides.

Nowadays many people are concerned about the arising problem causing by global warming and deforestation. While some people think that global warming leads to serious problemss that should be addressed first, others contend deforestation has a much more damaging impact on the earth's environment. Both sides of this debate will be analyzed in this essay.

Global warming has raised the average of temperature of the earth several degrees over the few centuries which ~~it~~ has negative effects on our habitats, the earth planet. For example, global warming results in the icebergs melting at the poles, which then leads to several effects such as extreme floods and storms. Rising of sea levels has put some cities surrounded by the water ~~on~~ at the risk of being drowned by deluges. Hence, it is argued that global warming is one of the most serious problems of our planet.

On the other hand, Forests have a critical role in absorbing greenhouse gases, which fuels global warming. In other words, removing the forests means that a large amount of carbon dioxides will enter the atmosphere and begin the greenhouse circle. The forests are natural habitats for many species ~~in~~ on the earth and if we continue to ruin their homeland, they cannot /will not be able to survive so the effects of deforestation are completely obvious.

In conclusion, the effects of them in our world are indisputable, it is impossible to say that one issue leads to more problems than the other. Therefore, we can hope both the people and the government

all over the world; take some steps to alleviate the ecological problems that our planet is facing.
