

Increasing the price of petrol is the best way to solve growing traffic and pollution problems.

To what extent do you agree or disagree?

What other measures do you think might be effective?

Nowadays, increasing the price of fuel is the issue that most governments of the world are involved with it and try to handle it with a proper solution.

First of all, I think increasing the price of petrol is not the best way and it is the simplest way that comes to mind. It leads to increasing the cost of transportation which in turn brings about higher prices for goods and services. All of the aspects must be investigated carefully before any action for this issue and government can consult experts and university professors.

Secondly, raising the price of petrol is not an effective way to solve the air pollution. Therefore, the government must develop cleaner fuels. Using hybrid cars is another method to replace fossil fuels. Government can give facilities to consumers to use electric cars and help manufacturers to develop new technologytechnologies.

In my opinion, government plays an important role in enhancing the culture for using a public transportation. People usually use the subway and buses when availability of them is not difficult and can walk to the stations in less than 10 minutes from their home, so it leads to reducing traffic considerably.

On the other hand, we cannot expect government to solve all the problems alone and people must aid it in tackling the issues. For example using bicycles and hybrid motorcycles helps to reduce the air pollution and traffic. However, creating bicycle roads encourages people significantly.

So overall, I believe that, increasing the price of fuel is not the-onlyan appropriate option for reducing the air pollution and traffic, so all the aspects must be examined properly.
