

Most of the people suffer from air pollution nowadays. Even though technology improvement is an advantage, producing a large number of cars brings about more traffic and pollution particularly in big cities. Use of public transport is highly recommended in order to reduce the pollution. The manner the government encourage people to use it should be considered.

In my opinion, availability of transportation means plays an important role in public transport development. Most of the people prefer to use their own car since they cannot access the mentioned means near their home. Therefore, increasing the number of stations all over the city is absolutely effective.

Moreover, the quality of public transport is another main factor in encouraging the people to use the-such means. In other words, only if the government enhances all aspects of transportation, will the people attract more. For instance, a long lineup for each kind of transport means besides high amount of population leads to rising-an increase in arrival time which in turn causes more stress. So, people tend to use their private car in such these situations.

On the other hand, the government even can facilitate using of public transportation means through providing more carparks nearby each station which is especially it-is applicable for subway stations.

Consequently, further to the above explanation, public transport means such as the subway, buses and taxis are quite essential since by-which air pollution will be decreased all over the city as a result of it.
