Nowadays we are producing more and more rubbish.

Why do you think this is happening?

What can governments do to help reduce the amount of rubbish produced?

Nowadays, I think more rubbish which is produced by a huge amount of consumption is a vital issue that all the countries are involved with compare to the past. However, the government plays an important role in reversing this destructive trend/reducing the amount of rubbish.

In the first place, I think that a rate of consumption is a problem that must be examined carefully. A more consumption causes people to produce more rubbish which in turn brings about more pollution in the environment. The mentioned issue particularly has been observed in big cities because of population growth. Moreover, packaging of goods produces rubbish when we use them too. Also, use of disposable products is so common these days that makes matters worse.

After that, I think the government plays an important role in controlling the produced rubbish. It can enhance the culture of society by training. In addition, the government can encourage or fine people to motivate them to separate rubbish from their houses. For instance, in Vancouver city the government fine households and shops that do not attempt to recycle their waste, so the a large amount of rubbish will be reduced by this method. Moreover, the government can establish places to which in people deliver their recycled rubbish.

Last but not least, the government can impose taxes on plastic bags to encourage discourage people to from buying them less plastic bags. For example in Canada and most of the European countries, shops take the cost of plastic bags from the customers if they do not have any suitable devices to carry their goods.

So overall, I believe that all of the methods that were mentioned above will be implemented with the help of all nations to save the world.
