

## Many people believe that scientific research should be carried out and controlled by the governments rather than private companies.

To what extent do you agree or disagree with this opinion?

It is obvious that scientific research has direct impacts on human`s life and with no doubt governments should take responsibility for citizen`s health. ~~Whereas~~ however, private companies could help the governments to attain this ambitious goal.

On the one hand, most of the private companies work on some projects which are based on monetary gain. Therefore, owing to the fact that scientific research projects are mostly long-term with small amount of profit, there are few private institute who like to invest in this field. In other words, ~~the~~ governments have enough budget to spend on such projects and also they are aware of all ~~the~~ side effects of not caring about citizen`s being health.

On the other hand, since scientific topics are diverse and wide, individuals could cover up some of them which are not carry out by the governments. Although private institute are given the right to do scientific research, they must be strictly monitored by the governments as some of them might be doing it for destructive weapons. To exemplify, some companies might focus on developing biochemical weapons which could threaten the world peace.

To conclude, as the governments have large amount of budget to spend on such non-profitable projects, not only are they ~~the main~~ mostly responsible for undertaking scientific research for citizen`s healthy life, but also they should exert a tight control on private corporation's activity in this area to reach a terrific result.
