

Safety standards are important when building people's homes. Who should be responsible for enforcing strict building codes – the government or the people who build the homes?

Nowadays, the safety standards checklist based on which that the a specific accommodation is built~~has passed~~, is a vital factor for the buyers. There are a group of people who believe that it is one of the the responsibility-responsibilities of the government to avoid construction of unsafe buildings whereas there are another group who think that the constructors should obey the standards themselves. While both views make sense, I would argue that governments' responsibilities are more important in constructing sturdier buildings.

It is crystal clear that if the constructors follow an ethic code and take a thorough responsibility for what they build, then it is not necessary for governments to take any steps toward observing safety of the homes being built. For example, the constructors could come to an agreement about following a specific standard which could be managed through their cartel-guild and applying those standards, then there will be no worries about buildings' safeness, but nevertheless with all respect to these people, I believe that when it comes to making more money they will forget about following the codes and try to finish the job by reducing as much expenses as possible.

On the other hand, governments have the power of imposing strict rules on construction, hence they will feel more responsibilities-responsibewill entail on them. For instance, the government could fine the companies for not carrying out the safety basics, Therefore, the constructors will be forced to follow the safety codes and not to overlook them. Although most governments implement such laws very strictly, there are few that are acting very lenient and will recompense avoiding safety rules by monetary penalties which I believe should be stopped.

To conclude, whereas people who build homes are responsible for the life of the prospective inhabitants of those buildings, the government plays a more significant role in this case and I believe that it is the main entity responsible for the safety of the constructions.
