

The importance of biodiversity is being more widely recognized as increasing numbers of species come under threat. What can be done to maintain biodiversity?

Since the past, with the advent of the industrial revolution and modern humans, enormous differences have happened on the Earth such as destructing the Earth's surface for the sake of farming and housing, deforestation, air pollution, overusing all resources and also diminishing in biodiversity. Although modern humans bring about a lot of benefits for all creatures like treating them with vaccination, preparing some food, the effect of their misbehaviors are more significantly undeniable than those of that. Lack of biodiversity is one of the important issues which human beings cause to happen.

It is a fact that survival of all creatures, even humans is related to biodiversity and the presence of bio-circular, hence humans' safety and living. The first and foremost step which should be taken in this area is to collect all the data and information about all creatures around the world that are still alive. It is extremely important to have a completed database of their habitats and also their needs and the way of their reproduction. No matter ~~how does it~~what the cost, it is a vital action to maintain all species safe. Another step to take is paying attention to rare and specific animals who are under extinction. Obviously, not only, should they have had proper preservation condition, but also there is a necessity to provide them with some appropriate condition for their breeding. Indeed, it is not an essential action that all extinction creatures which have been destroyed by humans' activities to bring ~~came them~~ back, because it has countless expenditures and time to spend on. Perhaps, it is better for humans ~~trying to try~~ to preserve just the ~~existence-existing~~ ones. However, the balance is always stricken by the ecosystem only.

Moreover, there should be some strict rules to prevent all factory managers and other relevant ~~authority-authorities~~ from polluting the environment with waste, swage water, mineral ~~contaminates-contaminants~~ and aerosols. There is an obvious fact that says, no one can deny that humans are the only creature that causes a lot of issues on the Earth.

In conclusion, it is crystal clear that the presence of all species affects each other's survival and creates ~~bio-circular~~life cycles, hence ~~the importance depiction~~ of biodiversity. Undeniably, the more people do not pay attention to their surroundings, the more they find themselves in dangers.
