

Governments and big companies should work together to reverse environmental damage, rather than making individuals responsible for that. To what extent do you agree or disagree with this statement? Give your opinion with relevant examples.

Preservation of the environment is a heated debate amongst many people from all walks of life across the globe, and when it comes to this notion I maintain that though it is mainly incumbent upon the authorities and manufacturers to save the only planet known to harbor life, I subscribe to the view that the significant role of the ordinary members of society to this purpose should not overlook.

Producing a large portion of the industrial pollution, major corporations, by and large, do not care about damages they are causing to old Mother Nature. With the power of the law in most societies, lawmakers can introduce appropriate laws to limit the emission of greenhouse gases and other major pollutants contributing to environmental damages. In other words, only when both the governments and big companies cooperate with one another, can we expect to reduce the adverse impacts of environmental problems.

Having said that, I opine that the role of individuals should not be omitted, albeit apparently insignificant. Humans, though minor, can take part in preserving the environment. Undoubtedly, the damages an individual can cause to nature is not comparable with those-that of a large factory, but if the majority of people reduce their damages to nature we can expect unpredictably-incredibly desirable results. A typical example of this could be a day without personal means of transportation in metropolitan areas. Not only are such plans practical ones to reduce air pollution in urban areas, but they are also a giant step to effective teamwork to address this life-threatening problem.

To cut a long story short, I argue that to save our planet we all have to cooperate together or sooner or later we will regret the damages-harms we have made. It is high time we all cooperated to save the environment or future generations will fall into serious problems.
