

Plastic waste, chips and nuts' packages or other kinds of litter all around the city is-are becoming an important issue which highlights/emphasizes/underpin strikes the necessity of recycling these days. By new methods of recycling, these pieces of trash could alter to usable goods again which not only save a large amount of time and energy but also can survive the environment from being polluted to a great extent. Some believes that it is only incumbent on the government to adopt an efficient method or even to create a new law by which recycling becomes s more popular among citizens. While I do agree that the government could have a major role in this regard, I think people also must be educated about the recycling culture.

First, the vast majority of our daily foods s is going directly to the-wastegarbage along with other non-food waste such as plastics or papers which make up about 20% of domestic waste. Although this is a disaster that is happening in most developing countries, there is-are almost no facilities for people to separate these amounts s of waste while disposing of them. Therefore, the first priority should be on informing the importance of categorizing of wastes s; that is, people need to learn how they could divide their household waste into different groups such as bio-waste, plastics s, glasses es and papers s.

On the other hand, in the aforementioned countries there is little-scarcity of facilities for waste disposal compared to the amount of garbage that is produced each day. Regarding this, the authorities could have a serious responsibility to improve their systems in order being-to be able to re-use the separated wastes s. taking advantage of new technologies, the government could devise new methods by which collecting waste and recycling could be much more accessible.

In conclusion, imposing severe laws could play a role as a motivator to encourage people to separate their rubbish. However, being educated about the importance of this behavior is far more beneficial. So it is vital that the governments make their effort firstly to inform people about the advantages of recycling and then bringingimposing laws when it's necessary to make this newly-learnedconstructive behavior abide in people minds.
