Nowadays we are producing more and more rubbish.

Why do you think this is happening?

What can government do to help reduce the amount of rubbish produced?

Answer

The question of producing a large amount of waste is an individual rather ~~than~~a social one. With Raising populations and industrialization, waste production growth trend will be aggravated. Hence, the government must launch out to minimize this trend. Nowadays, global warning and environmental issues are both consequential problems. Hence, the government should be allocated all their attentions on it.

In my view, there are a lot of ways to restrain from inevitable raise in waste produce. One way that the government can help alleviate this burden on the environment issues and global warning are by educating the general public as a whole. Another way is change policies to manufacturer's package by using alter material from polymeric to recyclable one. By this way the amount of plastic bags will be reduced and polymeric material has less available to the public.

On one hand, it is important that the government allocated and vindicated to researcher's plan, and new technics for recycle material. On the other hand, investing in those ways that are executable is so beneficial such as: the separation of waste by the people will greatly help the government to facilitate recycling or, seeking profit areas to recycle material which can less negative effect on environment and human health.

To conclude, although human population growth is steadily increasing, natural resources remain will be just as important as ever. Thinking to the posterity and preserving natural resources for them is a big responsibility for all people and the government.
