

Soon it will be scientifically possible to clone humans. What are the advantages and disadvantages of this?

Over the past 50-years technological developments burgeoning ceaselessly and on end. Admittedly there are a myriad of forces at play here but I broadly believe that the merits of clones outweigh the drawbacks, as will now be discussed.

Nowadays, hardly a day goes by without hearing the news about novel advancements in science and technology and the trend is set to continue. Human-cloning which entails numerous ingredients such as Artificial Intelligence is a highly contentious issue among the individuals.

First and foremost, it should be noted that clones will exquisitely bring about tremendous volume of convenience in people`s lives, to say the least. ~~Furthermore~~, these clones can be utilized in various aspects of our lives, for instance, they could do most of our chores whether in or out of people`s homes, besides, this labour-saving products would be very utilitarian in the case of disable-people and will ameliorate ~~presumptuous in the~~ extreme situations that they are in. It also worth bearing in mind that human-clones can save many lives ~~in terms of~~during wars and also will be deemed as an extra hand in future innovations and inventions.

However, although beneficial outcomes are countless, sceptics and advocates alike do concur on one conspicuous negative issue, that is, humans become endangered by these inventions either by getting out of control A.I minds or just malfunctions of the body-parts in the hour of need. Jobs or the lack thereof is another peculiar repercussion that deeply concerns individuals` minds in term of subsistence. In addition, decision-making is further major criteria that have currently mystified the scientists. All in all, none of the aforementioned problems is susceptible of a simple solution and clearly the path toward scientists is steep and strewn with challenges.

To put it in a nutshell, when all is said and done, I maintain that clones will be one of the main necessities of the future generations, thereby, in order for people to have better understanding about the traits of these commodities, governments and especially companies who are involved in the process of making clones can foster good practice by disseminating information about the status, merits and demerits of these creations.
