

The exploration and development of safe alternatives to fossil fuels should be the most important global priority today.

To what extent do you agree or disagree?

Today, research and development for clean energies is a main issue which most of the countries are dealing with.

First of all, everyone knows that fossil fuels render our planet ~~becomes~~ warmer compared to the past. Also, global warming is a phenomenon that causes seas and oceans levels to rise higher which in turn leads to some places where people live sinking in water. In addition, the damage to the protective ozone layer are-is caused by carbon dioxide and other by-products of fossil fuels is a main problem which cannot be ignored.

It leads to people sinking

It leads people to sink

What led him to kill his wife?

What led to him killing his wife?

Americans replaced Obama with Trump.

They substituted yoghurt for cream.

For all those mentioned above clean energies should replace fossil fuels. The government can develop hybrid cars and give facilities to motivate people. However, people must aid the government to implement this culture. This is why the role of the government is important in this regard.

On the other hand, this problem cannot be solved by one country alone. I think issues (which are) related to the earth must be shared with the United Nations, so the rules that are enacted must be implemented by all countries. There is a sense that time is ticking away for our planet and any solutions to the energy issue will take time to achieve.

So overall, I believe that clean energies such as wind, water or solar power have much of a role to play in our future life and this cannot be overlooked since everyone is responsible for next generations.
