

The exploration and development of safe alternatives to fossil fuels should be the most important global priority today.

To what extent do you agree or disagree ?

Without any doubt, it is a fact these days that fossil fuels are the main source of energy to use for many factories such as Oil, Methane gas, Gas and Coal. Of course in most of the countries, governors produce Methane gas which is natural for their people, who need to turn on their oven or go to warm their water for daily use in houses. These fuels, which were discovered and found in early ages by people, who look for it, show many disadvantages and harmful effects on our life system and environment that **it** seems the Earth may be shouting in some aspects like global warming and climate changing.

Energy has always been **the** first priority in human life, from the cave to our flats. We shall see the development of these changes in history, **having** caused many events. ~~Which leading to may have been the~~ start of many civilizations and developing cities. Back to human history, most **of** wars are **happened-happening** by this matter, like world wars, which could relate to many aspects and modern times.

However, I would hold this view that crowded population all over countries, may cause this issue. “ Burn to warm, not run to calm. “
Scientists and **inventersinventors**, **geniouslygenius** (cleverly), could help to find a **magnificent-practical** solution or an **incredible-efficient** way, as well as the fossil fuels are for every day life.

To sum up, I totally agree to **replace**(replace) our common source of energy ~~to-with a~~ better one. Although, ~~it-this new form~~ must ~~to~~ have these factors, **it needs to have the potential to be recycled and be contains- recyclament(recyclable)** , harmless and improve our **disactivities**(inactivity). The Earth seems like our ship ~~so-carrying~~ us. We must act **in a** more friendly **way**.
