

Nowadays we are producing more and more rubbish.

Why do you think this is happening?

What can governments do to help reduce the amount of rubbish produced?

In this day and age, ~~a~~the huge amount of waste is a main problem which most of the countries are dealing with. Therefore, plenty of solutions are suggested in order to decrease it, particularly in overcrowded areas.

In my opinion, an increase in the rate of population can be seen significantly compared to the past which in turn causes each household to produce more rubbish. Besides, the amount of consumption is not comparable with that ~~of it~~ in the past. In other words, the use of packaged foods rather than fresh ones is common nowadays ~~rather than fresh ones~~. Not only do such foods render waste more, but also our precious natural resources will regrettably be used up since most of the packaging materials are produced through oilfossil fuels. Furthermore, a large number of people are used to applying disposable products by which the amount of rubbish will rise dramatically. In addition, plastic bags have much of a negative role in this regard. Obviously, these artificial substances take ages to dispose of, hence being a major source of pollution.

Considering the solutions, the government is responsible for reducing large amounts of waste. The manner the government educates individuals and enhances culture of society is crucial factor. For instance, the government can put /introduce/impose/levy taxes on packaging or ~~gives~~ vendors positive reinforcement in order to give charge more money for plastic bags from customers. However, I strongly believe people have their own responsibility to decrease rubbish through observing the mentioned factors. Only if ~~anybody~~ every individual puts their every effort into solving this vital problem, will the amount of this pollution be reduced considerably. Last but not least, advancing recycling systems by the government can be absolutely effective. Also, my firm conviction is that spread of applying renewable materials in bags and packaging which is a novel alternative is has been developing becoming common all over the world during recent years.

Consequently, the mentioned source of pollution meaning rubbish is rising-worsening day by day because of more consumption and time is ticking away for our planet, so any solution will take time to produce the desired result.
