

**Scientific Research should be carried out and controlled by the government rather than private companies. Do you agree or disagree?**

The scientific achievements of a country can boost the economy. However, There has been a heated debate amongst individuals as to whether the responsibility of controlling and funding these researches should lay lie with the government or commercial institutes. I would argue that the solution is one of partnership.

The merits of gaining scientific advances encourage the governments to play an active role in managing them in many societies which brings many advantages. To start with, the government can facilitate the research process with their authority and funding. Having the state's support, scientists can dedicate themselves to their study wholeheartedly. Moreover, the governments are mostly bombarded with critics-criticism by their opponents. That is to say, there is a pressure on them to keep their promises which can assure researchers of financial assistance.

However, some believe that the governments could not professionally lead scientific studies due to their lack of experience in academic issues and the task should be assigned to private institutions. These companies have valuable experience in completing projects by hiring university professors to guide young scientists and experts to accurately plan for their targets, thereby making a profit. The downside of this trend is that these organizations mostly accept projects with high probability of success, therefore many an innovative thesis would be unacceptable. That a striking feature of science is its unpredictability is an undeniable fact, so all ideas are worth searching. Since almost the government has the resources to cope with the losses incurred during the project I opine that it is better to have the government's fund and the private organization's management to gain the best result.

In conclusion, the significance of scientific advances is a compelling reason to make the government support these researches/studies financially and appoint commercial companies to lead them.
