

The charts compare the ratio of population in ~~the~~ three age groups in 2000 with a projection for 2050 in Yemen and Italy.

By a glance at the two pie charts in Yemen, we can see the majority of the population constituted 0-14 and 15-59 years in 2000, about 46.3 and 50%, respectively. Also, it is predicted that by 2050, the former will follow a fall by 13% while the latter will increased to 57.3%. Similarly, the numbers of the elderly will grow from 3.6 to 5.7%.

However, in Italy the majority of the population accounted for 15-59 years in 2000 which is predicted to be half of that in 2050. Moreover, the remainder made up 24.1 and 14.3% for the age groups of more than 60 and 0-14 years, respectively. The former is projected to be doubled whereas the latter will see a slight drop in 2050.

Overall, in the both countries the group of 15-59 year-olds represents a significant proportion numbers of the population, although ~~the that numbers~~ of 0-14 years are considerable in Yemen.
