

There are serious concerns about the sale and production of genetically modified food. Yet this is necessary if we are to meet the demands of an increasing world population. Give your opinion on this.

As world population rises, it is becoming more evident we should find various ways for providing and feeding world population. Also, we may be faced with a serious food crisis. All the while, it is claimed that genetically modified food is the only solution to solve these-this crisis. In my opinion, there is not any justification to farm crops that they may harm on-human health and environment.

Scientists be-are often convinced that GM products are available and the quickly-
quickest way to solve these-this problem (crisis). Through sciences, plants can be made to grow faster and give massively production. Although the quality of these crops is extremely important. But also, in my view, GM food is not a good way/the
answer.

However, many parts of the world such as Africa continue to experience famine and starvation, therefore there is one country that they can be claimed GM food can be-helped them to reduce food shortage. Many parts of the world are used to rely-ing on international food aidaid food. It means that, while-the government should be-considered to create-creating different new ways for increasing food. Also, they might assign many moneybigger budgets to this area-in-these way.

In conclusion, whilesince, we are to meet the demands of an increasing world population. So, the government should be-hadpay special attention to the issue. Furthermore, we have to be-considered the impacts of GM food on human health and the environment before increasing produce-production of GM food and people use-using them.
