

Increasing the price of petrol is the best way to solve growing traffic and pollution problems.

To what extent do you agree or disagree?

What other measures do you think might be effective?

In this technological age which we live in, the indiscriminate use of fossil fuels, through the growing number of cars and urbanization, ~~have~~ has ended in many ~~dilemmas~~ challenges from traffic congestion to air pollution and noise pollution. It is undoubtedly true if we humans do not take actions to prevent this progressive catastrophe of global proportions, we will be faced with more serious challenges sooner or later.

Definitely, there are several procedures to tackle this issue. Raising the price of petrol is proposed as a solution but is there any guarantee that implementing this policy can be effected solely and without any care with regard to whether there is an adequate infrastructure? Of course not. For one thing, the existence of alternative public transportation plays a determinative role in the achievement of this method. So without due care, other drawbacks will emerge such as inflation!

One of the other strategies to remedy these pollution issues is establishing the use of sustainable energy resources such as electricity. And also enhancing the quality of cars, and strengthening ing the rules related to vehicle emission standards is of great importance.

In terms of traffic implementing systems to monitor ~~roads~~ road congestions, installing and improving public transportation in terms of numbers facilities accordingly can be extremely useful in discouraging private transport thereby adjusting the number of cars on the roads.

Last but not least, promoting citizens' education /awareness inevitably is a substantial factor which brings about a better life through collaboration in solving a huge number of problems. For instance, in this case, they can carpool, turn to cycle cycling and other env-frndly measuress ~~on~~.

In conclusion, I believe every concern has a solution and every solution depends s on many other factors. But the point is that we can overcome any difficulties and

when it comes to the environments every single one of us isare responsible for each other ~~and also other creatures~~.
