

Do you agree or disagree with the following statement?

It is better to have broad knowledge of many academic subjects than to specialize in one specific subject.

Use Specific reasons and examples to support your answer.

Many people named the current era as the age of knowledge era based on the proved importance of knowledge and its role. As there are is several number of different fields of study studies, some believe that it would be more efficient for the society and its people to just allocate their limited valuable time to be professional in is just one specific major instead of learning knowledge from of multiple unrelated different subjects. From my stand point, becoming professional in is only one field is the better option on the following grounds.

First and foremost, nobody is able to be perfect in every scientific field due to their characteristics. There is a famous sentence that says every person is born a unique talent to be profession in some subject and the duty of that person is to find his matched subject. For instance, I searched about many different academic fields when I was deciding about my major at the university ranging from medicine medical doctor to history and science. Ultimately, I find out that computer engineering is the best match given according to my personality ies and talents. However, my brother got his degree on medicine that made him a successful person.

In the second place, today's knowledge in every academic subject is increasing with a high ratio up to this point that experts in an academic subject divide their field of study to some subfields to be able to study the necessary knowledge in just one of them. For example, at the school of computer science in our out university, there are some laborator iesy that professors who are researching there are totally unaware of each other due to the fact that not only doare they find it impossible to be specialize in all of the subjects in their department, but also somehow they consider them as a different major according to the increasingly grand scale of the knowledge.

On the other hand, it is essential for every individual to be have the sufficient understanding of each subject of study. As a tangible example, it is necessary for everybody to have some superficial knowledge of their body organs to keep them healthy. In other words, to some extent td people who are placed placing in different

~~deferent~~ position in ~~the~~ society should be aware of each other's subject to just meet their personal needs. Moreover, for some serious problems~~s~~ that they may encounter about each field of study it would be more efficient to refer to experts in that field instead of spending ~~a~~ high portion of their life ~~to~~ just learn~~ing~~ the ability to solve possible problem that ~~they~~ might not even ~~be~~ faced~~d~~ with ~~it~~ in their whole life.

In a nutshell, different persons have different talents which ~~makes~~ ~~made~~ the learning of an academic subject that is matched to their characteristics~~s~~ far much easier for them. What is more, the scope of study fields ~~is~~ ~~are~~ incredibly expanding. Studying and being knowledgeable in such a broad field is too hard or even impossible ~~which~~ ~~that~~ forces~~s~~ academicians to split it in several subfields. Whereas~~,~~ to some necessary basic level, people should learn about different academic subjects.
